CHAPTER 1

Overview

pyaaf2 is a python module for the reading and writing Advanced Authoring Format (AAF) files.

1.1 Quickstart

1.1.1 Installing

You can install pyaaf2 via:

```
pip install pyaaf2
```

or if you want to use the latest development git master:

```
git clone https://github.com/markreidvfx/pyaaf2
cd pyaaf2
python setup.py install
```

1.1.2 Reading

```
import aaf2

with aaf2.open("path/to/file.aaf", "r") as f:

    # get the main composition
    main_compostion = next(f.content.toplevel())

    # print the name of the composition
    print(main_compostion.name)

    # AAFObjects have properties that can be
```

(continues on next page)

(continued from previous page)

```
# accessed just like a dictionary
print(main_compostion['CreationTime'].value)

# video, audio and other track types are
# stored in slots on a mob object.
for slot in main_compostion.slots:
    segment = slot.segment
    print(segment)
```

1.1.3 Embedding Footage

First lets generate some DNxHR media with ffmpeg:

```
ffmpeg -f lavfi -i testsrc=size=960x540 -frames:v 24 -vcodec dnxhd -pix_fmt yuv422p -
profile:v dnxhr_lb sample.dnxhd
```

Now lets generate some audio media:

```
ffmpeg -f lavfi -i aevalsrc="sin(420*2*PI*t):s=48000:d=1.0" -acodec pcm_s16le sample.
-wav
```

Finally import the footage:

```
import aaf2

with aaf2.open("example2.aaf", 'w') as f:

    # objects are create with a factory
    # on the AAFFile Object
    mob = f.create.MasterMob("Demo2")

    # add the mob to the file
    f.content.mobs.append(mob)

    edit_rate = 25

    # lets also create a tape so we can add timecode (optional)
    tape_mob = f.create.SourceMob()
    f.content.mobs.append(tape_mob)

    timecode_rate = 25
    start_time = timecode_rate * 60 * 60 # 1 hour
    tape_name = "Demo Tape"

    # add tape slots to tape mob
    tape_mob.create_tape_slots(tape_name, edit_rate,
                               timecode_rate, media_kind='picture')

    # create sourceclip that references timecode
    tape_clip = tape_mob.create_source_clip(1, start_time)

    # now finally import the generated media
    mob.import_dnxhd_essence("sample.dnxhd", edit_rate, tape_clip)
    mob.import_audio_essence("sample.wav", edit_rate)
```

1.2 About the AAF File Format

AAF is a file format used for professional multimedia creation and authoring. The file specification is managed by the Advanced Media Workflow Association ([AMWA](#)).

AAF uses a object-oriented data model. The data model has a single inheritance class hierarchy and classes have properties that store metadata. Classes, properties, and types each have unique ids, known as a Authoring Unique Identifier (AUID). AAF and MXF are closely related, The AAF data model is the basis for the MXF data model.

The Compound File Binary Format (CFBF) is what AAF uses for binary storage. CFBF, also called Structured Storage or Object Linking and Embedding (OLE), is a file format developed by Microsoft for storing hierarchical data. CFBF is basically a FAT32 filesystem in a file and AAF uses “directories” as classes and “files” to store property metadata.

1.3 aaf2 package

1.3.1 Submodules

1.3.1.1 aaf2.ama module

`aaf2.ama.get_wave_fmt(path)`

Returns a bytearray of the WAVE RIFF header and fmt chunk for a *WAVEDescriptor Summary*

`aaf2.ama.get_aifc_fmt(path)`

Compute the AIFC header information for a *AIFCDescriptor Summary*

Parameters `path` – file to read chunk from

Returns a bytearray

`aaf2.ama.create_network_locator(f, absolute_path)`

class `aaf2.ama.FormatInfo(metadata)`

Bases: object

Provides convenient access to commonly-used datums

`streams`

`first_sound_stream`

```
first_picture_stream
create_descriptor(f, path)
container_guid
edit_rate

Returns The edit rate of the first picture stream, or if there are none, the first sound stream.

length

Returns The length of the first picture stream, or if there are none, the first sound stream.

create_wav_descriptor(f, path)
create_aifc_descriptor(f, path)
coalesce_descriptors(f, descriptors, path)
create_multistream_descriptor(f, path)

class aaf2.ama.StreamInfo(metadata)
Bases: object

codec_type
codec_name
is_sound
is_picture
edit_rate
length
physical_track_count
create_pcm_descriptor(f)
pixel_sizes()
get_avc_compression()
get_compression()
create_video_descriptor(f)
```

aaf2.ama.create_media_link(f, path, metadata)

Create an essence linked to external media and all obligatory mobs and data structures required by the edit spec.

The returned aaf.mobs.MasterMob will have one slot for each video stream and each audio channel in the file at *path*.

Example: The linked file is a Quicktime movie with picture and a stereo audio track. This function will create a SourceMob with three slots, one picture slot, and two sound slots, for audio channels one and two respectively. The function will also create a derivation SourceMob, linked to these slots.

Parameters

- **f** – The aaf.File to add this link to
- **path** – A path recognizable to *os.path*
- **metadata** – Pre-fetched media description (in the form of a dictionary) from “ffprobe -show_format -show_streams”

Returns A *aaf.mobs.MasterMob* linked to the file at link.

1.3.1.2 aaf2.audio module

```
class aaf2.audio.WaveReader(f)
    Bases: wave.Wave_read

    getblockalign()
```

1.3.1.3 aaf2.auid module

```
class aaf2.auid.AUID(hex=None, bytes_le=None, bytes_be=None, int=None)
    Bases: object
```

A higher performance UUID class that is more specialized for AAF.

```
bytes_le
bytes_be
int
hex
uuid
data1
data2
data3
data4
```

1.3.1.4 aaf2.cache module

```
class aaf2.cache.LRUNode
    Bases: object

class aaf2.cache.LRUCacheDict(size=512)
    Bases: object

    make_first(node)
    get(key, default=None)
```

1.3.1.5 aaf2.cfb module

```
aaf2.cfb.pretty_sectors(fat)

class aaf2.cfb.Stream(storage, entry, mode='r')
    Bases: object

    storage
    dir
    mode
    pos
    fat_chain
    tell()
```

```
seek (offset, whence=0)
is_mini_stream()
sector_size()
sector_offset()
sector_index()
read (n=-1)
allocate (byte_size)
write (data)
truncate (size=None)
close()

aaf2.cfb.is_red(entry)
aaf2.cfb.is_not_red(entry)
aaf2.cfb.is_parent_of(parent, entry)
aaf2.cfb.validate_rbtree(root)
aaf2.cfb.jsw_single (root, direction)
aaf2.cfb.jsw_double (root, direction)
aaf2.cfb.find_entry_parent (root, entry, max_depth)
aaf2.cfb.get_entry_path (root, entry, max_depth)

class aaf2.cfb.DirEntry (storage, dir_id, data=None)
    Bases: object

        storage
        parent
        data
        dir_id
        name
        type
        color
        red
        left_id
        right_id
        child_id
        class_id
        flags
        create_time
        modify_time
        sector_id
```

```
byte_size
mark_modified()
left()
right()
child()
add_child(entry)
insert(entry)
    Inserts entry into child folder tree. Tries to maintain a balanced red black tree. Technique is base on topdown insert approach in described in https://eternallyconfuzzled.com/red-black-trees-c-the-most-common-balanced-binary-search-tree
pop()
    remove self from self.parent folder binary search tree. Tries to maintain a balanced red black tree. Technique is base on topdown remove approach in described in https://eternallyconfuzzled.com/red-black-trees-c-the-most-common-balanced-binary-search-tree
rebalance_children_tree()
path()
open(mode='r')
isdir()
isroot()
listdir()
makedir(relative_path, class_id=None)
isfile()
get(name, default=None)
touch(name)
write()
read()

aaf2.cfb.extend_sid_table(f, table, byte_size)

class aaf2.cfb.CompoundFileBinary(file_object, mode='rb', sector_size=4096)
    Bases: object

    close()
    setup_empty(sector_size)
    write_header()
    read_header()
    iter_difat()
    write_difat()
    read_fat()
    write_fat()
    read_minifat()
```

```
write_minifat()
write_modified_dir_entries()
write_dir_entries()
next_free_minifat_sect()
next_free_sect()
read_sector_data(sid)
get_sid_offset(abs_pos)
dir_entry_sid_offset(dir_id)
dir_entry_pos(dir_id)
read_dir_entry(dir_id, parent=None)
clear_sector(sid)
next_free_dir_id()
get_fat_chain(start_sid, minifat=False)
mini_stream_grow()
fat_chain_append(start_sid, minifat=False)
free_fat_chain(start_sid, minifat=False)
create_dir_entry(path, dir_type='storage', class_id=None)
free_dir_entry(entry)
remove(path)
    Removes both streams and storage DirEntry types from file. storage type entries need to be empty dirs.
rmtree(path)
    Removes directory structure, similar to shutil.rmtree.
listdir(path=None)
    Return a list containing the DirEntry objects in the directory given by path.
listdir_dict(path=None)
    Return a dict containing the DirEntry objects in the directory given by path with name of the dir as key.
find(path)
    find a DirEntry located at path. Returns None if path does not exist.
walk(path=None, topdown=True)
    Similar to os.walk(), yeilds a 3-tuple (root, storage_items, stream_items)
validate_directory_structure()
exists(path)
    Return True if path refers to a existing path.
makedir(path, class_id=None)
    Create a storage DirEntry name path
makedirs(path)
    Recursive storage DirEntry creation function.
move(src, dst)
    Moves DirEntry from src to dst
```

```
open(path, mode='r')
    Open stream, returning Stream object
```

1.3.1.6 aaf2.components module

```
class aaf2.components.Component(media_kind=None, length=None)
    Bases: aaf2.core.AAFObject
        class_id = 0d010101-0101-0200-060e-2b3402060101
        length
        datadef
        media_kind

class aaf2.components.Segment(media_kind=None, length=None)
    Bases: aaf2.components.Component
        class_id = 0d010101-0101-0300-060e-2b3402060101
        cutpoint

class aaf2.components.Sequence(media_kind=None, length=None)
    Bases: aaf2.components.Segment
        class_id = 0d010101-0101-0f00-060e-2b3402060101
        components
        component_at_time(edit_unit)
        index_at_time(edit_unit)
        positions()

class aaf2.components.NestedScope(media_kind=None, length=None)
    Bases: aaf2.components.Segment
        class_id = 0d010101-0101-0b00-060e-2b3402060101
        slots

class aaf2.components.SourceReference(media_kind=None, length=None)
    Bases: aaf2.components.Segment
        class_id = 0d010101-0101-1000-060e-2b3402060101
        mob_id
        slot_id
        mob
        slot

class aaf2.components.SourceClip(start=None, length=None, mob_id=None, slot_id=None, media_kind=None)
    Bases: aaf2.components.SourceReference
        class_id = 0d010101-0101-1100-060e-2b3402060101
```

```
start
walk()

class aaf2.components.Filler(media_kind=None, length=None)
Bases: aaf2.components.Segment
class_id = 0d010101-0101-0900-060e-2b3402060101

class aaf2.components.EssenceGroup(media_kind=None, length=None)
Bases: aaf2.components.Segment
class_id = 0d010101-0101-0500-060e-2b3402060101

class aaf2.components.EdgeCode(media_kind=None, length=None)
Bases: aaf2.components.Segment
class_id = 0d010101-0101-0400-060e-2b3402060101

class aaf2.components.Pulldown(media_kind=None, length=None)
Bases: aaf2.components.Segment
class_id = 0d010101-0101-0c00-060e-2b3402060101

class aaf2.components.ScopeReference(media_kind=None, length=None)
Bases: aaf2.components.Segment
class_id = 0d010101-0101-0d00-060e-2b3402060101

class aaf2.components.Selector(media_kind=None, length=None)
Bases: aaf2.components.Segment
class_id = 0d010101-0101-0e00-060e-2b3402060101

class aaf2.components.Timecode(fps=25, drop=False, length=None)
Bases: aaf2.components.Segment
class_id = 0d010101-0101-1400-060e-2b3402060101

start
fps
drop

class aaf2.components.OperationGroup(operationdef, length=None, media_kind=None)
Bases: aaf2.components.Segment
class_id = 0d010101-0101-0a00-060e-2b3402060101

operation
parameters
segments

class aaf2.components.Event
Bases: aaf2.components.Segment
class_id = 0d010101-0101-0600-060e-2b3402060101

class aaf2.components.CommentMarker
Bases: aaf2.components.Event
class_id = 0d010101-0101-0800-060e-2b3402060101

class aaf2.components.DescriptiveMarker
Bases: aaf2.components.CommentMarker
```

```
class_id = 0d010101-0101-4100-060e-2b3402060101
```

1.3.1.7 aaf2.content module

```
class aaf2.content.Header(*args, **kwargs)
```

Bases: `aaf2.core.AAFObject`

```
class_id = 0d010101-0101-2f00-060e-2b3402060101
```

```
class aaf2.content.ContentStorage(*args, **kwargs)
```

Bases: `aaf2.core.AAFObject`

This object has all Mob and EssenceData objects in the file

```
class_id = 0d010101-0101-1800-060e-2b3402060101
```

```
mobs
```

Access to all the Mobs objects in the aaf file.

```
toplevel()
```

Convenience generator method that yields only TopLevel `aaf2.mobs.CompositionMob` objects.

```
mastermobs()
```

Convenience generator method that yields only `aaf2.mobs.MasterMob` objects.

```
compositionmobs()
```

Convenience generator method that yields only `aaf2.mobs.CompositionMob` objects.

```
sourcemobs()
```

Convenience generator method that yields only `aaf2.mobs.SourceMob` objects.

```
link_external_mxf(path)
```

```
link_external_wav(metadata)
```

Create a link source MOB to a wav file, along with a corresponding master MOB and tape MOB.

Returns a 3-tuple: a master mob, the source MOB whose essence is a WAVEDescriptor link, and a source MOB whose essence is a TapeDescriptor.

```
create_ama_link(path, metadata)
```

```
essencedata
```

Access to `aaf2.essence.EssenceData` objects in the aaf file.

1.3.1.8 aaf2.core module

```
class aaf2.core.AAFObject(*args, **kwargs)
```

Bases: `object`

```
classdef
```

```
name
```

```
unique_property
```

```
unique_key
```

```
read_properties()
```

```
validate()
```

```
write_properties(validate=True)
```

```
detach(delete=False)
```

```
attach (dir_entry)
walk_references (topdown=False)
copy (new_dir=None, root=None, classdef_cache=None)
properties ()
allkeys ()
keys ()
get (key, default=None, allkeys=True)
getvalue (key, default=None)
dump (space="")
class_id
dir
property_entries
root
```

1.3.1.9 aaf2.dictionary module

```
aaf2.dictionary.short_name (name)
aaf2.dictionary.lookup_def (dictionary, name, instance_type, key)
class aaf2.dictionary.DefinitionObject (auid=None, name=None, description=None)
    Bases: aaf2.core.AAFObject
        class_id = 0d010101-0101-1a00-060e-2b3402060101
        name
        short_name
        description
        auid
        uuid
        unique_key
class aaf2.dictionary.DataDef (auid=None, name=None, description=None)
    Bases: aaf2.dictionary.DefinitionObject
        class_id = 0d010101-0101-1b00-060e-2b3402060101
class aaf2.dictionary.OperationDef (auid=None, name=None, description=None)
    Bases: aaf2.dictionary.DefinitionObject
        class_id = 0d010101-0101-1c00-060e-2b3402060101
        datadef
        media_kind
        parameters
        number_inputs
```

```

class aaf2.dictionary.ParameterDef (auid=None, name=None, description=None, type-def=None)
    Bases: aaf2.dictionary.DefinitionObject
    class_id = 0d010101-0101-1d00-060e-2b3402060101
    typedef

class aaf2.dictionary.PluginDef (auid=None, name=None, description=None)
    Bases: aaf2.dictionary.DefinitionObject
    class_id = 0d010101-0101-1e00-060e-2b3402060101

class aaf2.dictionary.CodecDef (dictionary, auid=None, name=None, description=None, class-def=None, datadef_names=None)
    Bases: aaf2.dictionary.DefinitionObject
    class_id = 0d010101-0101-1f00-060e-2b3402060101

class aaf2.dictionary.ContainerDef (auid=None, name=None, description=None)
    Bases: aaf2.dictionary.DefinitionObject
    class_id = 0d010101-0101-2000-060e-2b3402060101

class aaf2.dictionary.InterpolationDef (auid=None, name=None, description=None)
    Bases: aaf2.dictionary.DefinitionObject
    class_id = 0d010101-0101-2100-060e-2b3402060101

class aaf2.dictionary.TaggedValueDef (auid=None, name=None, description=None)
    Bases: aaf2.dictionary.DefinitionObject
    class_id = 0d010101-0101-4c00-060e-2b3402060101

class aaf2.dictionary.Dictionary
    Bases: aaf2.core.AAFObject
    class_id = 0d010101-0101-2200-060e-2b3402060101
    setup_defaults()
    register_def(defobject)
    lookup_typedef(name)
    lookup_datadef(name)
    lookup_containerdef(name)
    lookup_codecdef(name)
    lookup_parameterdef(name)
    lookup_operationdef(name)
    lookup_interpolationdef(name)
    lookup_taggedvaluedef(name)
    update(other)

```

1.3.1.10 aaf2.essence module

```

class aaf2.essence.EssenceData (*args, **kwargs)
    Bases: aaf2.core.AAFObject
    class_id = 0d010101-0101-2300-060e-2b3402060101

```

```
unique_key
mob_id
mob
open(mode='r')

class aaf2.essence.EssenceDescriptor(*args, **kwargs)
    Bases: aaf2.core.AAFObject
        class_id = 0d010101-0101-2400-060e-2b3402060101
        locator

class aaf2.essence.FileDescriptor(*args, **kwargs)
    Bases: aaf2.essence.EssenceDescriptor

1.3.1.11 aaf2.exceptions module

```
exception aaf2.exceptions.AAFError
    Bases: Exception

exception aaf2.exceptions.AAFAttachError
    Bases: aaf2.exceptions-AAFError

exception aaf2.exceptions.AAFPropertyError
    Bases: aaf2.exceptions-AAFError

exception aaf2.exceptions.CompoundFileBinaryError
    Bases: aaf2.exceptions-AAFError
```

1.3.1.12 aaf2.file module

```
class aaf2.file.AAFFactory (root)
    Bases: object
    from_name (name, *args, **kwargs)
    create_instance (*args, **kwargs)

class aaf2.file.AAFObjectManager (root)
    Bases: object
    create_temp_dir ()
    remove_temp ()
    add_modified (obj)
    pop (path, default=None)
    read_object (path)
    write_objects ()

class aaf2.file.AAFFile (path=None, mode='r', sector_size=4096, extensions=True, buffering=8192)
    Bases: object
```

AAF File Object. This is the entry point object for most of the API. This object is designed to be like python's native open function. It is recommended to create this object with the `aaf.open` alias. It is also highly recommended to use the with statement.

Warning: If an exception is raised inside the with block and the file was opened as writable, the final file should be considered bad or corrupted.

Take this snippet as an example:

```
try:  
    with aaf.open('/path/to/aaf_file.aaf', 'r+') as f:  
        raise ValueError('asd')  
except:  
    pass
```

in this case, even if the exception is properly handled, the content of /path/to/aaf_file.aaf shouldn't be trusted anymore.

For example. Opening existing AAF file readonly:

```
with aaf.open('/path/to/aaf_file.aaf', 'r') as f:
```

Opening new AAF file overwriting existing one:

```
with aaf.open('/path/to/aaf_file.aaf', 'w') as f:
```

Opening existing AAF in read and write:

```
with aaf.open('/path/to/aaf_file.aaf', 'rw') as f:
```

Opening in memory BytesIO file:

```
with aaf.open() as f:
```

header

`aaf2.content.Header` object for AAF file.

content

`aaf2.content.ContentStorage` object for AAF File. This has the Mob and EssenceData objects.

dictionary

`aaf2.dictionary.Dictionary` for AAF file. The dictionary property has DefinitionObject objects.

setup_empty()

writeable

resovle_weakref(index, ref_pid, ref)

weakref_prop(index)

weakref_index(pid_path)

read_reference_properties()

write_reference_properties()

dump()

save()

Writes current changes to disk and flushes modified objects in the AAFObjectManager

close()

Close the file. A closed file cannot be read or written any more.

1.3.1.13 aaf2.interpolation module

```

1.3.1.16 aaf2.mobid module

Excerpt from SMPTE ST 330 (Focus on Basic UMID):

5 General Specification

A unique material identifier (UMID) provides for the globally unique identification of any audiovisual material.

This standard defines a dual approach through the specification of a basic UMID and an extended UMID.

The basic UMID provides a globally unique identification for audiovisual material that comprises an integer number of one or more contiguous material units. The basic UMID has no embedded mechanism to distinguish between individual material units within a single instance of audiovisual material. The data in the basic UMID can be created through automatic generation.

The extended UMID comprises the basic UMID followed immediately by a source pack that provides a signature for material units. The source pack comprises a fixed length metadata pack of 32 bytes that provides sufficient metadata by which source ?when, where and who (or what)? information can be identified regardless of current ownership or status. The extended UMID also provides a mechanism to distinguish between individual material units within a single instance of audiovisual material.

The basic UMID is 32 bytes long and the extended UMID is 64 bytes long.

Both UMID types use the key-length-value construct defined by SMPTE ST 336. The key is a 16-byte universal label truncated to 12 bytes.

In the case of the basic UMID, the length field has a value of 13h and the value is formed by the combination of a material number and an instance number.

In the case of the extended UMID, the length field has a value of 33h and the value is formed by the combination of the material and the instance numbers followed by the source pack. All components of the UMID have a defined byte order for consistent application in storage and streaming environments.

The components of the basic UMID are:

1. A 12-byte universal label,
2. A 1-byte length value,
3. A 3-byte instance number, and
4. A 16-byte material number.

The combination of the instance and material numbers can be treated as a dumb number.

Note: The material number does not indicate the status of the material (such as copy number) or its representation (such as the compression kind). The material number can be identical in copies and in different representations of

(continues on next page)

(continued from previous page)

the material. The purpose of the instance number is to separately identify different representations or instances of audiovisual material. Thus, for example, a high-resolution picture and a thumbnail can both have the same material number because they both represent the same picture but, because they are different instances, they will have different instance numbers for the different representations. Guidance for the consistent application of new material numbers and instance numbers is given in SMPTE RP 205.

UMID universal label (SMPTELabel)

| Byte No. | Description | Value (hex) | Meaning |
|----------|------------------------|-------------|--------------------------|
| <hr/> | | | |
| 1 | Object identifier | 06h | Universal label start |
| 2 | Label size | 0Ah | 12-byte Universal label |
| 3 | Designation: ISO | 2Bh | ISO registered |
| 4 | Designation: SMPTE | 34h | SMPTE registered |
| 5 | Registry category | 01h | Dictionaries |
| 6 | Specific category | 01h | Metadata dictionaries |
| 7 | Structure | 01h | Dictionary standard |
| 8 | Version number | 05h | Version of the metadata |
| 9 | Class | 01h | Identifiers and locators |
| 10 | Subclass | 01h | Globally unique |
| <hr/> | | | |
| 11 | Material type | XXh | See Section 6.1.2.1 |
| 12 | Number creation method | YYh | See Section 6.1.2.2 |

6.1.2.1 - Material type identification

Byte 11 of the UL shall define the material type being identified using one of the values defined in Table 2. The use of material types '01h', '02h', '03h' and '04h' shall be deprecated for use in implementations using this revised standard. These values are preserved only for compatibility with systems implemented using SMPTE ST 330:2000#

Table 2

| Byte value | Meaning | |
|------------|---|--------------------------|
| <hr/> | | |
| 01h | picture material | |
| 02h | audio material | |
| 03h | data material | |
| 04h | other material | |
| | Deprecated (originally not only picture, audio, or data material, but also a combination of material types) | (continues on next page) |

(continued from previous page)

| | | |
|-----|--|--------|
| 05h | single picture component | e.g. ↴ |
| 06h | Two or more picture components in a single container | e.g. ↴ |
| 07h | ↳ interleaved Y, Cb and Cr components | |
| 08h | single audio component | e.g. ↴ |
| 09h | ↳ mono audio | |
| 09h | two or more audio components in a single container | e.g. ↴ |
| 0Ah | ↳ AES3 audio pair | |
| 0Bh | single auxiliary (or data) component | e.g. ↴ |
| 0Ch | ↳ sub-titles only | |
| 0Ch | two or more auxiliary (or data) components in a single container | e.g. ↴ |
| 0Dh | ↳ multiple sub-titles streams in different languages | |
| 0Dh | mixed group of components in a single container | e.g. ↴ |
| 0Eh | ↳ video & stereo audio pair | |
| 0Fh | material type is not identified | |

6.1.2.2 Number creation method identification

Byte 12 of the UL shall define the method by which the material and instance numbers are created. This byte is divided into top and bottom nibbles for the purpose of this definition. The top nibble shall occupy the 4 most significant bits (MSBs) of the byte and the value shall be used to define the method of material number creation. The values used by this nibble shall be limited to the range 0 to 7h so that byte 12 conforms to the ASN.1 BER short form coding rules used by SMPTE ST 298. The methods of material number generation shall be as defined in table 3 and the specification of the each method shall be as defined in Annex A.

Note: New material number generation methods can be added by amendment or revision of this document. Each addition will provide the proposed value (within the range of values currently identified as "Reserved but not defined") for inclusion in Table 3 together with the supporting definition to be added to Annex A.

Table 3 - Identification of material number generation method::

| Value (hex) | Method |
|-------------|--------------------------|
| 0 | No defined method |
| 1 | SMPTE method |
| 2 | UUID/UL method |
| 3 | Masked method |
| 4 | IEEE 1394 network method |
| 5~7 | Reserved but not defined |

Notes from Pixar 10/30/17

Final note of discussion with Avid engineers how the top nibble in the 12th byte in the SMPTELabel should be set. (In the past we always had it set to 00, i.e. "no defined method", we had some confusion about how to set it when using a uuid for the material)

Avid Engineer:

"The specification of number creation identification is very clear about using the 4 MSBs for the material number so I am pretty sure that the numbers in the sub-titles of Annex A (e.g. 02h) should not be interpreted literally as values of

byte 12. 20h is the correct value of the byte 12 for UL/UUID method/No defined method.
 By the way, I don't see anything wrong with setting byte 12 to 00h (No defined method / No defined method)"
 We at Pixar decided to set the byte to 20h, since it (even if already very minimal) completely eliminates the possibility to collide with any MOB ID created by our old MOB ID generation algorithm.

```
aaf2.mobid.UniqueMobID()

class aaf2.mobid.MobID (mobid=None, bytes_le=None, int=None)
  Bases: object

  bytes_le
    static new()
      Static method for generating unique MobIDs. Uses uuid.uuid4() for generation.

    material
      MobID material representation as a UUID

    SMPTELabel

    length
    instanceHigh
    instanceMid
    instanceLow
    Data1
    Data2
    Data3
    Data4
    from_dict (d)
      Set MobID from a dict
    to_dict ()
      MobID representation as dict
    int
      MobID representation as a int
    urn
      MobID Uniform Resource Name representation. https://en.wikipedia.org/wiki/Uniform\_Resource\_Name
```

1.3.1.17 aaf2.mobs module

```
class aaf2.mobs.Mob (name=None)
  Bases: aaf2.core.AAFObject

  Base Class for All Mob Objects

  class_id = 0d010101-0101-3400-060e-2b3402060101
  unique_key
  name
  mob_id
    The unique Mob ID associated with this mob. Get Returns aaf2.mobid.MobID Object
```

```
usage
comments
slots
slot_at(slot_id)
create_timeline_slot(edit_rate, slot_id=None)
create_empty_sequence_slot(edit_rate, slot_id=None, media_kind=None)
Create an empty timeline slot and sets its segment to a new, empty aaf2.components.Sequence component.
Timeline slots are for continuous, monotonically-changing media, like picture and sound.

create_picture_slot(edit_rate=25)
Create an empty timeline slot, with the ‘picture’ media kind, and sets its segment to a new, empty aaf2.components.Sequence component.

create_sound_slot(edit_rate=25)
Create an empty timeline slot, with the ‘sound’ media kind, and sets its segment to a new, empty aaf2.components.Sequence component.

create_source_clip(slot_id=None, start=None, length=None, media_kind=None)
Create a SourceClip of Mobs slot with slot_id. If no length given the default length will be the full length
of slots segment minus start. Returns aaf2.components.SourceClip Object

dependant_mobs()
Yields all mobs that this mob is dependant on in depth first order.

class aaf2.mobs.CompositionMob(name=None)
